

Indian Road Safety Campaign
Making Roads Safer!

Presentation for Phase II By:

Aryan Varshney

Siddharth Chauhan (Team Leader)

Kaushal Kumar Singh

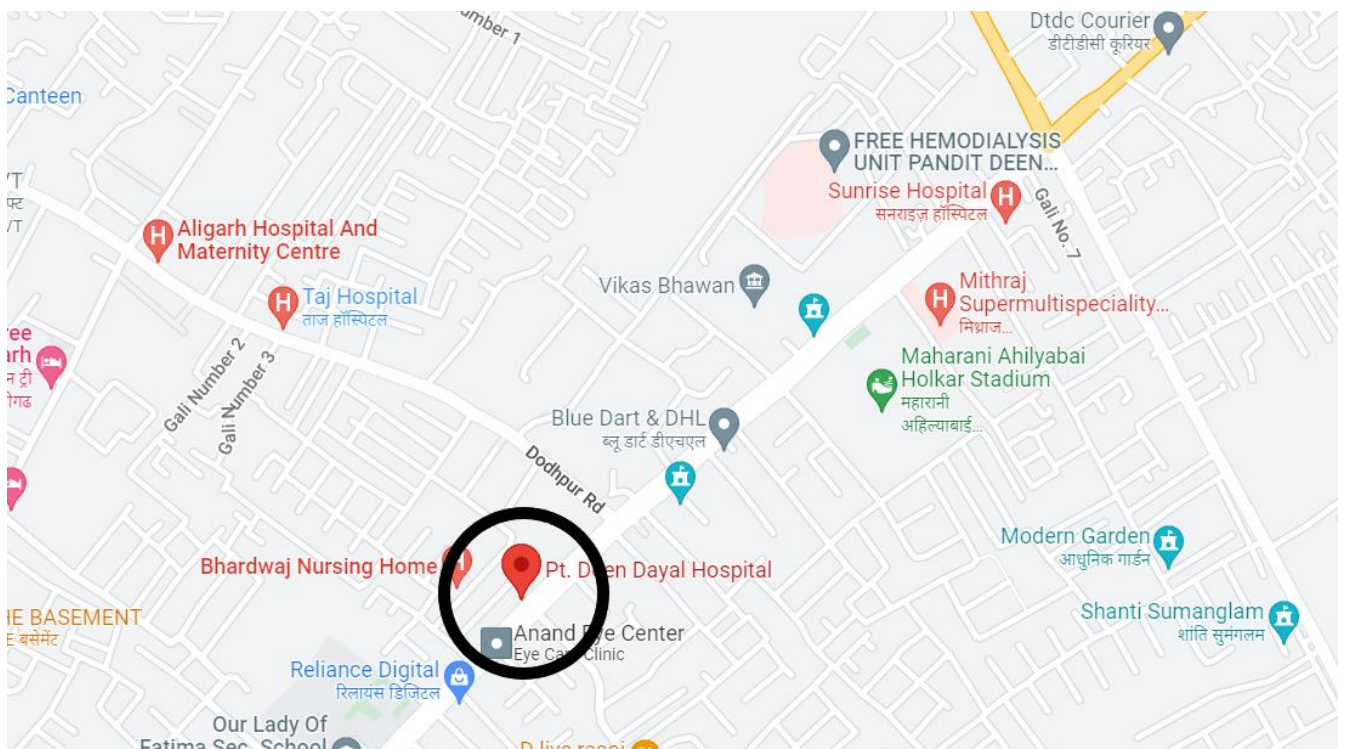

(Civil Engineering Department,
Z.H.C.E.T., A.M.U.)

SELECTED LOCATION-

As we have already observed in the presentation for Phase 1 that we have visited many sites within the city and collected data from various sources and government officials. After a careful analysis, we came to a collective decision to select “Ramghat Road (In front of Pt. Deendayal Upadhyay Hospital), Aligarh, Uttar Pradesh as our final site for work. The link for the location is given below.

Link-[Pt. Deen Dayal Hospital - Google Maps](#)

And snap for the same is-

ANALYZING TRAFFIC VOLUME-

Upon having a discussion regarding the problem with our College Professor Dr. M Rehan Sadique, we decided to move forward for the technical analysis for our selected spot by calculation of traffic volume.

On the very next morning, we along with the equipment went to the spot to perform our task by fixing the tripod and mounting the mobile camera on it (Site images are as attached below)

The video recording (as recorded from the mobile mounted on tripod) is also attached in the Google Drive Folder.

We recorded the data for the traffic volume multiple times on 2 consecutive days and the average observations for the same is as follows:

Lane	Date	Time Slot	2-Wheelers	Cars	Other Mixed Vehicles
1	14.03.2022	15:00-16:00	1940	360	684
	15.03.2022	11:50-12:50	1836	354	706
2	14.03.2022	4:05-5:05	1854	272	612
	15.03.2022	13:00-14:00	2012	320	640

From the above data, it is evident that the road is busy enough as we can observe from the above-mentioned data. So, we planned to think for the suggestions and solutions accordingly.

SURVEY OF STAKEHOLDERS-

Taking note of the instructions given in IRSC manual, we decided to go for interview of different category of stakeholders as our next proceeding. The categories and other detailed information are as mentioned below:

- Local Shopkeeper:

- School Watchman-

- Juice seller-

- Traffic policeman

We also interviewed two other categories of stakeholders:

- Private vehicle owner
- E-Rickshaw driver
- etc

We also asked our questions to all the above categories via survey and also noted down their suggestions. Although, we couldn't capture the videos or photos of the some of the persons, keeping their consent of privacy.

All the respective videos have been uploaded separately according to their phases.

QUESTIONS FOR SURVEY-

5 of the selected o

S.No.	Survey Questions	P1	P2	P3	P4	P5
1	Profession	Shopkeeper	Watchman	Juice Seller	Policeman	Housewife
2	Age	37	40	23	45	33
3	Travelling frequency via spot	Daily	Daily	Daily	Daily	Once in a week, on an average
4	Problems on this road	Road Congestion by vendors, Unawareness of Road Markings	Road congestion in front of school, problems by stones	Open sewer, Congestion	Lack of Awareness, Rash-Driving, Bike Stunts in night-time,	Parking Issue, Blurred marking and lack of marking info
5	Evident of any Accident	Yes	No	No	Yes, many were	No

					unreported	
6	Speed Limit	---	---	---	---	20-30
7	Should traffic markings be re-marked	Yes	Yes	Yes	Yes	Yes
8	Should there be any banner for Traffic Markings information	Yes	---	---	Yes	Yes
9	Proper Lighting	Yes	Yes	---	Yes	Yes

Multiple persons from each of the category were interviewed during our detailed survey by the team members. **An aggregate of approximately 25-30 persons were selected for the survey and the table shows almost one from each of the category. There were some more of the categories (like Ambulance Driver, E-Rickshaw Driver, Policeman from the Police Station having the jurisdiction.). Although , these persons were too having almost the same kind of problems which are already listed out in the chart.**

ROAD SAFETY AUDIT-

In the road safety audit, we decided to cover the maximum points that we can do to study the various parameters in order to present the solutions accordingly.

- Spot location- As indicated by the snap in the first slide we could see that one lane of the location heads towards Quarsi Chowraha (One of the busiest spots of the district), which is merely 200 m away while the other lane leads towards Dubey Ka Parao Chowraha, another busy location. So, to analyse the road, we decided to measure the traffic volume of the road with highest accuracy possible. The data has already been presented in one of the previous tables. From the result ,it is evident that the road is busy too and thus requires solutions in such a manner, such that it shouldn't affect the common public and should be feasible enough.

- Major Loopholes- The team performed the analysis up to the will and the outputs as well as the conclusion of interviews of stakeholders have been compiled into some selected points:
 - Lack of public awareness: This was the major point which was present not only in our desired location, but also in almost all possible spots of the city.

 - Not following Traffic Rules even after having basic knowledge of them: Many among the mass didn't bothered to follow the basic Traffic Rules, even though they were well aware of the regulations. Even the Police Inspector said that the bikers performed illegal traffic

stunts, driving via the route, particularly during the night time.

- Parking Problem: The vehicles in the parking mode didn't seem to be bothered about the congestion of the road. Although, a dedicated parking lot for the spot is not available in the locality, but still, maximum efforts can be adopted to minimize the congestion on the main pavement. Refer the below attached image regarding the parking problem.

- Congestion by the Vendors: This too is one of the most foremost problems that can be seen in the area. As there is a Community Hospital as well as a Trauma Centre, there is a notable presence of lot of fruit vendors, most of which park their cart, exceeding the firm line, which reduces the road area as well as increases the chances of collision.

➤ Speed of the vehicles coming from Quarsi chowraha:

As we have observed during our course of survey that, most of the vehicles that are approaching from the Quarsi Chowraha are coming with very high speed. And as we have seen in most of the cases high speed is one of the main causes of accidents.

➤ Open sewers: Sewers are mostly open in our selected site it causes reduction in the area available for the street vendors due to which vendors have to keep their cart near carriageway causing congestion, thus increasing the risk of accident.

The encircled area shows the open sewer

➤ Presence of Stones on the interlocking road: Stones (As visible in the below attached picture) seem to cause

more problem as compare to its benefits (we couldn't figure out its purpose). On one hand it is totally impractical to allot the area (between the two parallel alignment of stones) as footpath as there are obstructions such as electric poles, transformers and stray animals etc. which make it completely inaccessible to be used as a footpath. On the other hand, this area can't be used as a parking. As vehicles are aligned comparably more towards the road, which ultimately causes congestion.

Thus, in this presentation, we have tried to fulfil the points of Phase II, as much as possible. In the upcoming presentation, our focus shall be to suggest some feasible solutions that may prove worthy to reduce the chances of Road Accidents in that particular spot.

THANK YOU!!!
